

K8s installation:

- We need 2vm's with parameter 2vcpu and 4gb ram (maybe 3gn enough) it can be ubuntu as well.
- Use this link and try to provision k8s:
<https://devopscube.com/setup-kubernetes-cluster-kubeadm/>
- At the end for check is this ok try to execute on master node: ``kubectl get node both nodes`` must in **ready** state.
- Also create some **pod** and wait until it will be **running** and **ready** state

NOT: After installing Kubernetes, try to check the network connectivity:

1. First, use ``kubectl get nodes``.
2. Second, try running a pod from an **Ubuntu** image.
3. Third, enter this container and try to install something inside the **Ubuntu** image.

If this works, your network is functioning properly. If not, you will need to figure out the network problem.
